

Cloud Intelligence

Your Cloud. Your Rules. Your Sovereignty.

Empower your business with cloud infrastructure you fully trust.

Somieq is the next-generation private cloud service designed for organisations that demand uncompromising control, compliance, and flexibility. In an era where data privacy, regulatory compliance and performance are more important than ever, Somieq delivers the confidence of true digital sovereignty without sacrificing performance or agility.

What We Offer

Our private cloud infrastructure combines hardened security with the responsiveness of the cloud. Unlike traditional on-premises systems, our solution delivers the same trusted protections while removing the limitations of physical data centres.

With built-in resilience and end-to-end encryption, it's infrastructure that will safeguard performance for critical workloads and adapt to evolving operational demands.

We deliver a comprehensive suite of services to meet the full lifecycle of your IT needs:

A Cloud You Can Trust

At the heart of Somieq lies a sovereign foundation:

- Privately owned data centres, operated exclusively through trusted technical partners. No hyperscale dependency – all core infrastructure, hardware, and platforms are under our ownership
- Geographic clarity – complete transparency over data residency and jurisdiction.
- Controlled supply chain – equipment procurement and maintenance are tightly governed, ensuring end-to-end integrity and compliance.

Certified and Secure by Design

Security and compliance are integral to Somieq's DNA.

- We build, and are certified to, TIA-942 Level 3 standards, ensuring redundant infrastructure, fault tolerance, and guaranteed uptime.
- ISO27001, 27701 and SOC 2 certifications are in progress, supported by a mature ISMS and continuous monitoring framework.
- 24/7 monitored environments, operated by certified professionals under strict access control and full audit capability.

Why Private Cloud Matters

Private cloud empowers your organisation with the security, control, and flexibility of a dedicated environment, without the complexity of building and maintaining it yourself.

Modulo delivers a private cloud that is purpose-built for performance, security, compliance, and operational efficiency.

Enhanced Control and Security

Your data and workloads run in an isolated, dedicated environment, not shared with other tenants, reducing exposure and improving control over governance, compliance, and performance. Our dedicated security team constantly monitor and react to emerging threats in real time.

Performance and Reliability

With our infrastructure, you benefit from low latency, higher throughput, and consistent performance. We optimise our environments to deliver the uptime, redundancy and resilience features you need to reassure your business that their data is in safe hands.

Scalability Without Compromise

Scale compute, storage, or network resources seamlessly to meet demand, without the unpredictability of public cloud cost structures.

Predictable Costs, Optimised Usage

Private cloud can deliver the economics of the public cloud model, but with guaranteed capacity and consistent performance. You get transparency and predictable billing, linked directly to your capacity usage.

Compliance and Peace of Mind

Whether your operations are subject to national data protection laws, financial regulations, or industry compliance requirements, you always understand where your workload is located, workloads remain local, controlled, and auditable.

Expert Local Support

Our dedicated on-site teams provide personalised support and monitoring, ensuring fast response and accountability from people who understand your environment and business context.

Industry Trends

Private cloud adoption continues to grow as organisations seek balance between public cloud agility and private infrastructure control.

- Hybrid-first strategies: Many organisations are adopting hybrid models, running sensitive workloads in private cloud while connecting to public cloud for elasticity or global reach.
- Data protection and control: Increasing regulations and internal governance frameworks are pushing IT leaders to host critical workloads in controlled, private environments.
- Performance-driven workloads: Businesses with latency-sensitive or high-performance computing needs (e.g. analytics, AI, financial transactions) are moving back to localised private clouds.
- Cost predictability: Enterprises are seeking alternatives to unpredictable public cloud bills through consumption-based private models.
- Managed private cloud growth: Market leaders are expanding “private cloud as-a-service” models, bringing the agility of public cloud to dedicated environments.
